

THE CLIENT OUTCOME

Google Sheets + Apps Script automation for daily priorities, workload planning, and AI stakeholder updates.

A project manager can move from the shared task table to a focused action view or stakeholder draft without rebuilding filters, counts, and summaries by hand.

Keep Google Sheets as the familiar operating surface.

Use Apps Script for repeatable reporting logic and document creation.

Choose Gemini, Claude, or OpenAI without changing the PM workflow.

ONE SOURCE, THREE PROJECT-MANAGEMENT OUTCOMES

1

Prioritize

Filter open work into a daily action review.

2

Plan

Group workload by worker or project.

3

Report

Generate a review-ready stakeholder draft.

THE REPORTING PROBLEM

The task table may be current while the management view is already stale.

Project managers often repeat the same filtering, regrouping, and status-writing work because a flexible Sheet does not automatically create every decision view.

Daily review needs the right project, worker, priority, status, and due horizon.

Workload planning needs consistent open, overdue, blocked, and due-soon counts.

Stakeholder updates need concise language without detaching claims from source tasks.

WHAT CHANGES WHEN REPORTING BECOMES A WORKFLOW

Manual reporting loop

FILTER → COPY → COUNT → REWRITE

Every view is rebuilt from scratch.
Counts and narrative can drift apart.
The result depends on who prepared it.

Controlled report workflow

SELECT → PREVIEW → GENERATE

Filters are explicit and reusable.
Deterministic metrics remain attached.
AI drafts are reviewable, not authoritative.

THE STRUCTURED FOUNDATION

The Google Sheet supplies controlled task facts, calculated timing, and stable task IDs.

Apps Script reads a frozen owner-only copy of the public tracker. It does not depend on screenshots, free-form notes, or a second database.

- Project, worker, priority, status, and dates remain normal Sheet fields.
- Timing categories and recommended actions stay deterministic.
- Notes and email addresses are excluded from every AI request in version one.

GOOGLE SHEETS SOURCE TABLE

	A	B	C	D	E
1	Task Tracker				
2	Formula-driven timing, recommended actions, validation, and semantic co				
3					
4					
5	Edit task inputs in columns A:H and K:M. Columns I, J, and L calculate automatically through row 205.				
6	Completed		Overdue		
7	Task ID	Task	Project	Owner	Prior
8	TSK-1001	Approve refreshed homepage	Website Refresh	Avery Chen	High
9	TSK-1002	Repair mobile navigation	Website Refresh	Jordan Brooks	Critical
10	TSK-1003	Publish redirect map	Website Refresh	Avery Chen	High
11	TSK-1004	Archive stale CRM contacts	CRM Cleanup	Jordan Brooks	Medium

Focused proof view: task facts and calculated timing remain legible at presentation size.

STABLE TASK IDS

VALIDATED FIELDS

CALCULATED TIMING

THE AUTOMATION FLOW

One Apps Script menu turns report choices into validated, repeatable outputs.

The bound script reads the Sheet, validates the request, calculates metrics, refreshes report tabs, and creates a private Google Doc only when the user asks.

A document lock prevents overlapping report writes.

Daily Actions and Workload tabs refresh in place instead of multiplying copies.

Every stakeholder output records its source timestamp, provider, model, and task IDs.

BOUND APPS SCRIPT EXECUTION PATH

1

Select

Choose report, filters, grouping, project, and provider.

2

Validate

Normalize fields, cap inputs, and compute authoritative KPIs.

3

Write

Refresh a stable tab or create an owner-private Doc.

4

Review

Keep the draft labeled and traceable before sharing.

DAILY PRIORITIES

Daily review reduces the tracker to the work that needs attention now.

The same dialog can combine project, worker, status, priority, and due-horizon filters, then sort the result into an action-ready Sheet tab.

- Overdue and blocked work remains visible instead of being averaged into a dashboard.
- Task IDs, due dates, timing categories, and recommended actions stay together.
- The output is deterministic and usable even when every AI provider is unavailable.

DAILY ACTIONS REPORT PATTERN

Selected project Open work Due within five days			DETERMINISTIC
TASK	TIMING	NEXT ACTION	
TSK-1002 · Repair navigation	OVERDUE	Escalate now	
TSK-1006 · Resolve rules	BLOCKED	Resolve blocker	
TSK-1007 · Draft kickoff	DUE SOON	Prepare next step	

WORKLOAD PLANNING

Workload can be grouped by worker or project without inventing utilization percentages.

The report uses counts the Sheet can support: open, overdue, blocked, and due soon. It avoids false precision when hours or capacity data do not exist.

Switch grouping between worker and project in the same dialog.

Compare real task counts and timing risk instead of guessed capacity.

Refresh the stable Workload tab whenever the source Sheet changes.

WORKLOAD EVIDENCE IN GOOGLE SHEETS

Grouped by	Worker							
Group	Open	Overdue	Due today	Blocked	Due soon	No due date	Task IDs	
Jordan Brooks	4	1	0	2	1	0	TSK-1002, TSK-1004, TSK-1010, TSK-1016	
Riley Patel	3	0	0	1	2	0	TSK-1006, TSK-1010, TSK-1017	
Avery Chen	2	0	1	0	0	1	TSK-1003, TSK-1008	
Morgan Lee	2	0	0	0	2	0	TSK-1007, TSK-1013	

The proof uses supported counts—open, overdue, blocked, and due soon—without claiming unsupported utilization.

BY WORKER

BY PROJECT

NO INVENTED CAPACITY

CUSTOM APPS SCRIPT DIALOG

The dialog makes complex reporting choices usable without exposing implementation details.

One interface supports daily review, workload planning, and stakeholder updates while showing only the controls relevant to the selected report.

Show only the controls relevant to the selected report type.

Require one project and an explicit provider before a stakeholder update can run.

Keep one interface across daily review, workload, and stakeholder work.

LIVE BOUND APPS SCRIPT DIALOG

The screenshot shows a 'PM Report Builder' dialog box overlaid on a Google Sheets spreadsheet. The dialog has a title bar with a close button. Inside, it says 'GOOGLE APPS SCRIPT' and 'Build the PM view you need'. Below this, it instructs the user to 'Choose a deterministic operational report or an AI-assisted stakeholder draft.' A status bar indicates 'Frozen snapshot · 2026-07-25 · Source workbook preserved unchanged'. The main form contains three dropdown menus: 'Report' (set to 'Stakeholder update'), 'Project' (set to 'Project Aurora'), and 'AI provider' (set to 'Claude · claude-sonnet-5'). A small note below the AI provider dropdown states: 'AI-assisted draft — review before sharing. Claude and OpenAI keys stay in Secret Manager. Gemini uses owner-authorized Vertex AI.' At the bottom of the dialog are two buttons: 'Preview scope' and 'Generate report'.

Actual browser proof: report, project, and provider are explicit before the owner-private draft is generated.

ONE INTERFACE

EXPLICIT PROVIDER

NO KEY ENTRY

SECURE AI-ASSISTED REPORTING

Gemini, Claude, and OpenAI share one validated output contract—not one shared secret path.

The provider is chosen explicitly. Gemini runs on Vertex AI under the owner's Google authorization; Claude and OpenAI each use their own Secret Manager secret.

Only selected-project task facts and deterministic aggregates are sent; Notes and email addresses are excluded.

The draft is checked against source task IDs and supported figures before it becomes Google Doc text.

A refusal, malformed response, invented reference, or figure mismatch produces a deterministic Doc marked "AI narrative unavailable."

BROWSER-VERIFIED SECURITY AND REPORTING FLOW

REDACTED SECURITY ARCHITECTURE

Selected facts move through one controlled reporting path.

Provider access stays server-side; every generated Doc is verified owner-private.

LIVE PROOF: TWO SECRET RESOURCES · SECRET ACCESSOR ROLE · VERIFIED DOC OWNER-ONLY

No API key, OAuth token, email address, private Sheet ID, or private Script ID is shown.

Actual browser captures: explicit provider selection → private Doc → validated task-linked narrative → redacted IAM proof.

NO SECRET VALUES SHOWN

SHARED=FALSE VERIFIED

ACCESSOR ROLE SHOWN

CLIENT DELIVERY

Bring the Google Sheet your team still turns into reports by hand.

The next step is a bounded pilot around one real reporting decision, the Sheet fields that support it, and the review rules required before anything is shared.

Choose one daily review, workload, or stakeholder-reporting workflow.

Confirm the fields, filters, permissions, provider policy, and acceptance checks.

Reply on Upwork with the Sheet process you want simplified.

SMALLEST USEFUL PILOT

Map

Identify the source Sheet and management decision.

Build

Implement the dialog, reports, and safeguards.

Verify

Test real data, permissions, and failure behavior.

Hand off

Document operation, keys, and future BYOK options.
